

Import two exported classes with the same name

In typescript, using Angular 2, I need to import two classes with the same name, but lying in different paths.

72

The project is quite too big that I find it hard to change the exported class names.

Is there any way to alias the imported classes,

5

```
import {Class1} from '../location1/class1'  
import {Class1} from '../location2/class1'
```

angular

typescript

ionic2

You can using **as** like this:

160

```
import {Class1} from '../location1/class1'  
import {Class1 as Alias} from '../location2/class1'
```

You can find more about the ES6 import statement [here](#).
